2016 Pine Island Sound Scallop Survey

The 2016 Pine Island Sound Scallop Survey was held on Saturday, August 6th. This population study is held by the University of Florida's Institute of Food and Agricultural Science (UF/IFAS) under their Sea Grant marine extension service and partnered with the Sanibel Captiva Conservation Foundation (SCCF).

For the past seven years snorkelers have volunteered in this resource monitoring program to survey and document the health and status of bay scallop populations around Pine Island Sound.

This year about 110 volunteered to help with the survey. Boaters and kayakers alike received their materials and instructions before heading out and diving in to their assigned areas. This year's survey results recorded about 90 scallops, which is a slight increase over previous years. Bay scallops were once abundant throughout Southwest Florida's coastal waters, but declined over 30 years ago due to unstable environmental conditions, likely caused by urbanization of the coastline and nutrient enrichment of near shore habitats. Healthy sea grass beds are attributed to the steady increase in scallops from previous years.

Lily Hymenocallis spp.

Lilies are often seen around mid-summer in natural wetlands, but they sometimes ornament a roadside ditch, or along the bank of a storm water pond.

Two species of *Hymenocallis* that are often seen are the spider lily (*H. latifolia*) and the alligator lily (*H. palmeri*). The Spider lily is the showier variety of the two native lilies, and less particular about its soil conditions. Which makes it ideal for the home landscape as an accent plant or addition to a wildflower area. Alligator lily is less flexible and prefers moist soil locations. Nevertheless, it would be a natural fit for a rain garden or damp area in a landscape.

The Un-Tamed Wildlife of Cape Coral

The City of Cape Coral has many wildlife viewing opportunities that are unique to Southwest Florida. Including the state's largest population of Burrowing Owls, which has been declared as the City Bird. Additionally, the parks and natural areas around the city are host to over ninety species of migratory and non-migratory birds. The waterways contain many freshwater and saltwater fish as well manatees and other aquatic animals. Other urban wildlife includes raccoons, snakes, butterflies, gopher tortoises and countless others.

With as much wildlife within Cape Coral it is inevitable that humans and wildlife will cross paths. While it can be a tremendous opportunity to observe wildlife close-up, interactions can come as a surprise for many people. "The un-tamed wildlife of Cape Coral" is aptly titled; as it is wild. Therefore, some precautions are warranted.

Wildlife can sometimes be unpredictable. Often, wildlife are not people friendly and should not be regarded as a domestic animal. Likewise, care and caution should always be observed when viewing wildlife. View wildlife responsibly. If needed, modify behavior to avoid negative interactions with wildlife (i.e., disturbing feeding or nesting behavior).

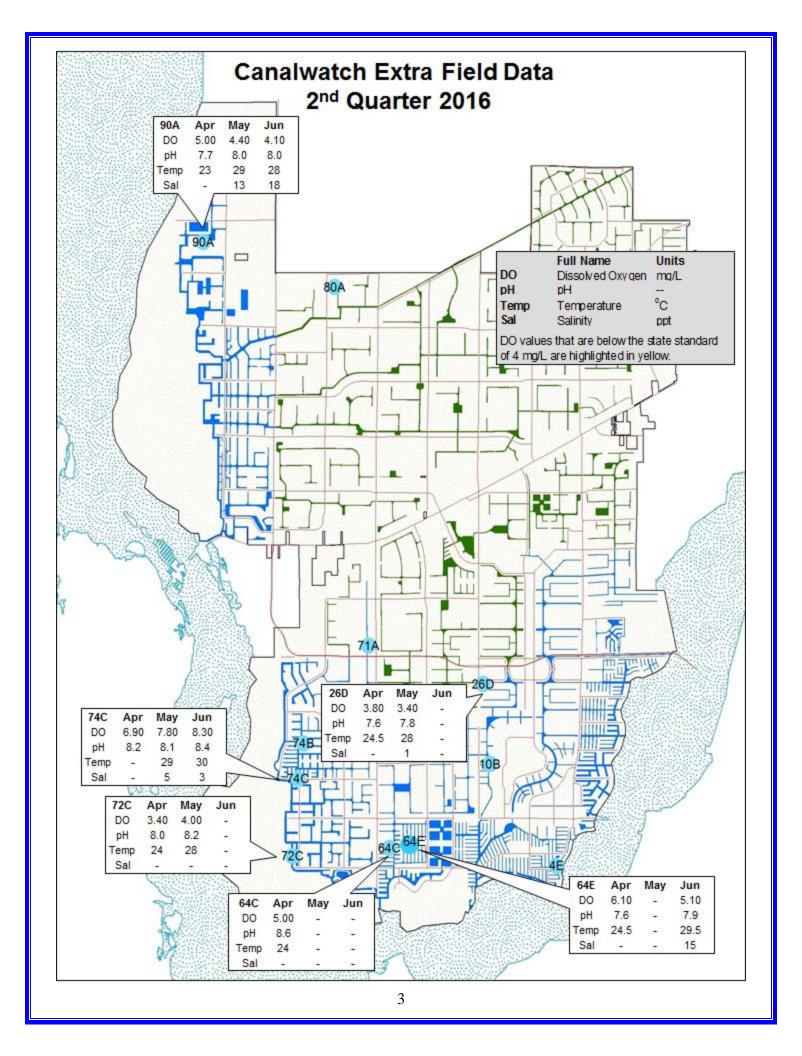

Here are some tips on enjoying wildlife viewing and some tips that will prevent negative interactions with wildlife, such as coyotes, alligators and river otters:

- o Never feed wildlife. This causes the animals to associate people with food.
- Many species of wildlife are attracted by garbage (or the rodents that are attracted by garbage.)
 Problems can be significantly reduced if residents secure trash. Secure pet food, clean up fallen fruit, and seeds beneath bird feeders. Secure garbage cans and compost in animal-proof containers.
- When filleting fish, dispose of fish scraps in garbage cans. Do not leave it on the dock or seawall. Although it is not intentionally feeding wildlife, the result can be the same.
- o Never attempt to pet or approach wildlife and ensure children keep their distance. Wildlife can become defensive or aggressive toward people or pets, especially when defending their young or a food source.
- Some wildlife can potentially injure domestic cats and small dogs. Attacks can be preventable. <u>To protect pets, never allow them to roam freely, keep them leashed</u>. Attacks often occur at night or at dusk or dawn. During these circumstances, observe caution while walking pets near wooded areas or in heavily foliaged areas where wildlife live.
- Keep cats indoors and never feed feral cats. Domestic cats allowed to wander freely, have an increased risk of injury by predators. Domestic cats also have the potential to spread disease or prey against native wildlife.
- o Encourage butterflies and birds to visit home landscapes by planting Florida natives as a natural food and habitat source, this is beneficial to both the wildlife and the environment.
- Use binoculars to observe wildlife natural behavior so to avoid stressing the animals. This can be a wonderful opportunity and an educational experience to share with children.
- Though rare, one natural behavior that may be observed is predator, prey interactions. Sometimes
 gruesome, sometimes fascinating to look at, nevertheless be aware that this is natural feeding behavior
 and controls the prey populations.

The City of Cape Coral does not retain permits to trap or remove any wildlife other than the invasive Nile Monitor Lizards (for more information on that program please visit:

www.capecoral.net/department/public_works/nile_monitor_trapping.php#.V2GUJ7srLcs.)

The taking of nuisance alligators; deer; bears; bats, bobcats, most migratory birds, their nests or eggs; turkeys; bobwhite quail; or state-listed or federally listed species of special concern, threatened or endangered species is prohibited by law or may require additional permits. If a resident is experiencing nuisance wildlife problems, we encourage them to contact Florida Fish and Wildlife's Wildlife Alert hotline at 888-404-3922.
